A triac is a solid state silicon AC switch which may be gate triggered from an OFF-State to an ON-State for either polarity of applied voltage.

POWER PAC™ triacs are molded silicone encapsulated devices which incorporate General Electric's patented POWER GLAS™ glassivation process. This process provides an intimate bond between the silicon chip and the glass coating, significantly improving device performance and reliability. The copper mounting surface on the isolated tab types is electrically insulated from the silicon chip and the three electrical terminal leads.

**FEATURES:**

- POWER-GLAS™ passivated silicon chip for maximum reliability.
- Very low off-state (leakage) current at room and elevated temperatures.
- Inherent immunity from non-repetitive transient voltage damage (max. critical rate-of-rise of on-state current subsequent to voltage breakover triggering,  $di/dt = 10 \text{ A}/\mu\text{sec.}$ ).
- Low on-state voltage at high current levels.
- Excellent surge current capability.
- 1600 volts RMS Surge Isolation Voltage on Isolated Triacs.
- Selected types available from factory for use where circuit requires operation:
  - with popular zero voltage triggering IC's
  - at 400 Hz
  - with low gate trigger current
  - at higher voltage levels
  - at higher commutating  $dv/dt$  levels

**POWER PAC PACKAGE**

- Meets JEDEC TO-220AB specifications.
- Round leads – greatly simplifies assembly.
- Six standard lead forming configurations available from factory (including TO-66 compatibility.)

- Rugged, industry-proven packaging.

TERMINAL ARRANGEMENT

NOTES:

- At the case reference point (see outline drawing) temperature of 80°C maximum (except 75°C maximum for SC142 and SC149) and 360° conduction.
- Ratings apply for zero gate voltage only. Ratings apply for either polarity of main terminal 2 voltage referenced to main terminal 1.
- Ratings apply for either polarity of main terminal 2 referenced to main terminal 1.
- Ratings apply for either polarity of gate terminal referenced to main terminal 1.
- Isolated tab triacs only. Rating applies from main terminals 1 and 2 and gate terminal to device mounting surface. Test voltage is 50 or 60 Hz sinusoidal wave form applied for one minute. Rating applies over the entire device operating temperature range.

SC146	-	-	1.50						
SC147	-	-	1.69						
SC149	-	-	1.52						
SC151	-	-	1.10						

NOTES:

1. Characteristic values apply for either polarity of main terminal 2 referenced to main terminal 1.
2. Main terminal 1 is the reference terminal for main terminal 2 and gate terminal.
3. With  $V_D$  equal to maximum allowable off-state voltage.
4. Values for these test conditions are:

Device	Commutating di/dt	$T_C$
SC140	3.5 A/msec	+80°C
SC141	3.2 A/msec	+80°C
SC142	4.3 A/msec	+75°C
SC143	4.3 A/msec	+80°C
SC146 / SC147	5.4 A/msec	+80°C
SC149	6.4 A/msec	+75°C
SC151	8.1 A/msec	+80°C

5. The junction-to-ambient value is under worst case conditions; i.e., with No. 22 copper wire used for electrical contact to the terminals and natural convection cooling.

6. Junction-to-case steady-state thermal resistance ( $R_{\theta JC}$ ) is tested in accordance with EIA-NEMA Standard RS-397, Section 3.3.2, which states: "Thermal characteristics are to be measured with the device operating in only one direction." The values listed are the limiting value for either direction. For non-isolated devices, the MT2 lead temperature reference point is approximately equal to the case temperature reference point (see outline drawing).
7. Apparent thermal resistance applies for a 50 or 60 Hz full sine wave of current. It can be calculated with the following formula:

$$\text{Apparent thermal resistance} = \frac{T_{J(\max)} - T_C}{P_{T(AV)}}$$

where:  $T_{J(\max)}$  = maximum junction temperature  
 $T_C$  = case temperature  
 $P_{T(AV)}$  = average on-state power

See Reference Chart 12.

11. SUBCYCLE SURGE (NON-REPETITIVE) ON-STATE CURRENT AND  $I^2t$  RATINGS

NOTES:

1. Curves apply for either polarity of main terminal 2 referenced to main terminal 1.
2. Curves for half sine wave current waveform.
3. Gate control may be lost during and immediately following the surge current interval.
4. Current surge may not be repeated until junction temperature has returned to within steady-state rated value.
5. Junction temperature immediately prior to surge =  $-40^{\circ}\text{C}$  to  $100^{\circ}\text{C}$ .

12. MAXIMUM APPARENT TRANSIENT THERMAL IMPEDANCE (50 AND 60 Hz SINE WAVE OPERATION)

NOTES:

1. Curve defines temperature rise of either junction above case temperature for equal amplitudes symmetrical sine wave current at 50 and 60 Hz.
2. Curve considers junction temperature measured immediately after the final cycle of current.
3. Gate will regain control if temperature is maintained below rated value and load current is reduced or maintained at RMS value.
4. For more than 100 cycles of current the case temperature rise must be observed and used in calculating the total junction temperature.
5. Junction temperature rise above case is defined as apparent transient thermal impedance times average conduction power dissipated during full cycle conduction.
6. Apparent steady-state value is not the same as JEDEC value listed as steady-state in characteristics table.

POWER PAC TRIAC PART NUMBER DESIGNATION

TYPICAL CIRCUITS

Triacs are especially useful in AC lamp dimming because of their ability to conduct in both directions.

The circuit shown here incorporates General Electric's ST4 asymmetrical AC trigger integrated circuit. This device greatly reduces the snap-on effects that are present in symmetrical trigger circuits and minimizes control circuit hysteresis. This performance is possible with a single RC time constant, whereas a symmetrical circuit of comparable performance would require at least three additional passive components.

The SC151D, in combination with an optically-isolated SCR (4N40), allows this highly transient immune, TTL compatible, zero voltage switching design for a normally open 15 ampere solid-state relay. Zero voltage crossing is sensed via the base emitter diode drop of the 2N3859 which then allows the 4N40 SCR portion to be triggered and apply gate signal to the SC151 triac. The transient immunity is designed in through use of the GE-MOV®, the snubber network and the choice of 400 volt semiconductors.
